Re: Patricia Caprez

DOB: 6/30/1946

To whom it may concern:

Ms. Caprez is a 71-year-old female who went for routine screening colonoscopy, not having previously remembered when her last colon screening was. She was found to have a lesion in her colon, this area was biopsied and consistent with a colon cancer. She was then seen by her surgeon, Dr. Touzios who performed a right hemicolectomy on 8/4/2015. Patient was hospitalized from 8/4/2015-8/7/2015. As can be seen in the discharge summary from medical records, her course was rather uncomplicated and she was discharged home with a diet restriction, lifting restriction for 4 weeks of 15 pounds. I met her for the 1<sup>st</sup> time on 8/18/2015. This was for consultation regarding her newly diagnosed colon cancer, stage IIIB. My recommendation, as per guidelines, was that she undergoes adjuvant chemotherapy with modified FOLFOX 6. Patient had a Mediport placed on 8/24/2015. She initiated chemotherapy on 8/25/2015. Her chemotherapy consisted of a clinic visit for an entire day of infusion on day 1 with a return for chemotherapy pump removal 48 hours later. This chemotherapy was given on an every 2 week basis.

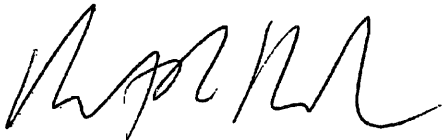

Dates of treatments are well documented in the medical records, which have been provided. During the dates of 8/1/2015-11/24/2015, patient underwent surgery and completed 7 of her cycles of therapy. Plan chemotherapy was for 12 total cycles which she did eventually complete.

The course of her treatment was complicated by significant diarrhea (Grade 2 at its worse), neuropathy (Grade 2 at its worse during this time frame). She had a significant decrease in appetite as well as weight loss. During this period of time patient did lose 10 kg of weight due to both surgery and chemotherapy. Diarrhea initially started after surgery, but continued to worsen throughout the course of chemotherapy. The diarrhea resulted in hypokalemia. Oral potassium supplementation was attempted but patient did not tolerate as it increased her diarrhea. This necessitated weekly lab checks and hydration with IV fluids and IV potassium. Her hypokalemia did increase her weakness. In an attempt to strengthen patient, she was involved in physical therapy at the cancer center with 1<sup>st</sup> visit on 8/17/2015 and last visit on 10/19/2015 during this period of time. Please see detailed documentation in the medical record regarding physical therapy evaluation and recommendations.

## **UWCancer Center at ProHealth Care**

In summary, Ms. Caprez required significant attention in the cancer center during this period of her treatment course as evident by the multiple visits as noted in the medical record. Her most significant side effects were fatigue (grade 2), diarrhea (grade 2), neuropathy (grade 2), anorexia (grade 3) and weight loss (grade 2). Given the duties listed in her job description, she would have difficulty working consistently due to fatigue and diarrhea. She would require frequent bathroom trips and breaks. Her neuropathy would have made it difficult to use many of the devices to consistently do her job during that period. Her frequent trips to the clinic for chemotherapy, pump removal, and intravenous fluids would have made a consistent schedule difficult.

Please do not hesitate to contact me with any questions or clarifications regarding my care of Ms. Caprez during this time period.
